Installation guide

The installation guide is in INSTALL.md at the repository root (Portuguese version: INSTALAR.md). It covers Conda, Docker and native installations on Windows, macOS and Linux, the optional RNArobo and Knotty engines, verification and troubleshooting.

RNArobo and Knotty (needed only by the RNArobo Search and Pseudoknot Finder pages) are installed inside the RSAS folder, in `bin/<platform>/`, without administrator rights: download RNArobo's ready-made Linux executable, build Knotty from source, or use the builds bundled in `bin/macos/` and `bin/windows/`. Step-by-step commands are in INSTALL.md, section 8.

On macOS, if RSAS.app or the bundled engines are reported as *damaged* or *cannot be verified*, they are not damaged: macOS blocks programs that are not notarized by Apple. Allow them in System Settings → Privacy & Security → **Open Anyway**, or remove the quarantine flag; see INSTALL.md, section 7.4.
